

Testing

1. Input set 1

Step 1 & 2:

Step 3: Shows the matched keypoints.

Step 4 & 5: In the function named “combineLeftRight”, we are checking if the transformed mask and extended mask are both 1 if it holds it should have calculated the average value of transformed and extended images. However, as you can see in the combined image, it does not seem to take the average, it just takes the extended image, and I could not understand why it happens. But, it shows us the panoramic image that we have wanted in the beginning.
